BIRD PROOFING NETS

Aesthetic, Transparent, Durable and Foolproof Solutions for Bird Menace

CO-POLYMER NYLON NET for Bird Proofing your Balconies, Pools, Pools, Restaurants, Industrial Units etc.

This net is made of co-polymer nylon which is transparent or black in colour having melting point of 260°C. The mesh size is usually 1 1/4" square. This net is very strong and durable as the breaking strength of yarn is 23.08 kg. This yarn is ultra-violet stabilised.

The main advantages of this Bird Proofing Nets are that these nets do not block air, light or visibility, does not corrode, aesthetic in look, economical compared to stainless steel nets. Can be re-fixed as these nets are fitted on open stainless steel hooks. Last but not the least, the menace of birds can be solved in a harmless manner without hurting or killing them.

Woven Geo Textile

Coco Fibre Beds

Coco Logs

Coco Felt

Coir Geo Textile is a natural woven solution to large scale soil erosion / soil degradation. It has achieved wide acceptance all over the world. As a natural product, Coir geo textiles are bio-degradable and environment friendly. It enables vegetation to take root on the applied area thus making the bonding of the soil very strong. They are ideal for application on hill slopes, road and rail embankments.

Coco Logs are non-woven coir fiber thickly filled inside tube shaped coir netting. The diameter of the Coco Log varies from 15 to 50 cms and come in lengths of 2 to 6 meters. These are mainly used for absorbing the impact of waves in erosion prone areas. The main area of application is stream bank protection against wave splashing and erosion control.

Coco Beds are non-woven mesh matting stitched together to form a pouch and then filled with coir fibre. The ends are stitched to form fibre beds, The thickness of which vary from 10 to 25 cms as per the requirement. They are mainly used as wave energy dissipaters.

Coco Felts are non-woven pads made by interlocking coir fibre through needling. These felt pads can be used for low cost acoustic control, air & water filtration, thermal insulation, and also for soil erosion control.

Commercial Green House horticulture offers scope of production of fancy crops in off-season with yield often far greater than achievable under conventional horticulture. The main purpose of greenhouse technology is to provide a good growing environment for successfully growing high quality plants round the year.

Greenhouses are structures covered with transparent to translucent materials which allows the solar radiation to pass through, but traps the thermal radiation emitted from the objects within. This creates a congenial environment for plant growth. Energy received from the sun is converted to heat within the greenhouse during the day as well as used for evaporate water during the normal transpiration of plants. The various parameters influencing plant growth such as Light, heat, CO₂ and moisture could be controlled in these structures.

ZeeGreen's experienced consultant's will help derive and implement the most economical green house for you.

Eco Floral Decoration

The art of design with the science of ecology. Our unique floral decorations creates a difference to your gifts and ambience.

Pitcher Plant

Belongs to family Nepenthaceae and is a carnivorous plant. This plant is commonly called 'Pitcher Plant'. An ideal plant for schools, colleges, universities, institutions, hospitality, residences. A natural support for reducing harmful insects around your environment.

Bonsai

As living spaces reduce in size, and love for bringing nature to close proximity, this art is gaining popularity in horticulture. Bonsai practice focuses on long-term cultivation and shaping of one or more small trees in a single container.

Lucky Bamboo

Spiral lucky bamboo has an evenly twisted top like a cork screw. The almost two foot spiral lucky bamboo can make for a very dramatic arrangement. It is the art of bringing natural elements of water, fire, earth, wood and metal into balance within the environment.
